

Project Title and Description

The name of the term project is “Smash112” which is a platform fighting game. This is a multiplayer game that enables two players to control characters in the game to fight against each other. The game will begin with a page that has instructions telling players the basic game rules: how to choose character, how to choose a fighting field, and keys control the character. Then, the player will enter a page that enables them to choose the character and fighting field. In this process, players can also press a designated key to view the special abilities each character has.

When players proceed to the actual fighting, there will be a health bar on each side of the laptop screen telling them how many life points their character has. Players can use the attacking ability and the defending ability of their characters to knock out the other side or defend the attack from the other player. When one player’s health bar first reaches zero. The game is over and the word game over will show up on the screen. Then, the game will enter a summary page that honors the winner. After this page, the players will have the choice to restart the whole game or have another game controlling the same character and fighting in the same field.

Moreover, AI players are also added to the game. Using the behavior tree algorithm, the AI player will control the other character to play against the human player. The AI player will also have different difficulty levels by prioritizing different values in the behavior tree.

Similar Project:

SmashBro, Stickman Fighter: Epic battle, Guilty Gear, and the King of fighters are studied or planned to be studied to inspire the design of the game. The abilities of different characters in the game will be studied and possibly recreated on the characters in my own game. The fighting field can also be recreated in my game. I will also study the character and field selection page’s design in these games and design a new selection page of my own. I will also study the keys these games use to control the character so my players can have an easier time adapting to my key control design to play with my characters.

Version Control:

All versions of my game are backed up daily into my private Github repository. I normally back up every time there is a major function or change added to my game. And I will try to maintain a daily update if there is any change made on my game.

Tech List:

No external modules/hardware/tech will be used in this process.
